

## Outdoor Hatches

**Outdoor hatches are installed to provide access to underground electromechanical networks or underground stairwells as emergency exits.**

They are certified as category A15 according to the EN124-1 standard.

They can be fire-resistant with a fire protection rating of 120 minutes to prevent the spread of fire between levels.

The fire-resistant hatches from SAFEDOOR have been selected and installed in many Attiko Metro stations.

They are watertight. To reduce the lifting weight of the cover, a hydraulic compression piston is provided. The movement hinges are heavy-duty.

Internally, they feature a handle or panic bar, while externally, there is provision for the occasional installation of a handle and the use of a recessed lifting grip for the cover.
